

# Kevco Vending's Going Green Initiative

Kevco Vending actively seeks to incorporate environmentally friendly practices by promoting green initiatives in our route operations and office activities. With these practices, we hope to complement green initiatives supported by our customers and that together we can make a significant difference in the Indianapolis area.

## Some Examples of our green initiative are as follows:

At Kevco Vending we try and reduce driving time by having our route people service our customers within a specific area. During service calls, we try and equip our service vehicles with the necessary parts to complete the vast majority of service calls on the first visit, eliminating the need for a return trip. Within our business practices we try to reduce, reuse, and recycle. All cardboard is recycled and we are actively retrofitting our machines to make them more energy efficient. Vending Misers are available on our vending machines to reduce power consumption. We are able to install Vending Misers on our vending machines to reduce power consumption and use LED Lighting.

## *How Does a Vending Miser Work?*

By monitoring both occupancy levels in the area around the vending machine and ambient temperature changes, the Vending Miser controller allows only enough power to keep the cooled product inside at the right temperature and have it ready to dispense when someone is in the vicinity, powering down costly heat generating lighting and denying compressor cycles to run when they are simply not required.
